# Release Notes

CWS Updates

## Enhancements & New Features

The .37R2 release includes updates to support connectivity to EVO 's choice for the EU markets Transactional Risk Assessment (TRA) engine, Riskshield:

Traditional card fraud changes due to the fact that a substantial share of card transactions are no longer related to the physical usage of the card. Security features like Chip/PIN are not applicable in Card-Not-Present transactions. The fastest-growing fraud without the actual card – either online, over the phone or through the mail, needs a different approach to protect an organization against these fraudsters.

RiskShield monitors in real-time all in-coming transactions of the (online) merchants. In addition, the pure payment transaction information, profiles, transaction histories and statistical data are made available inside RiskShield to identify any fraudulent transactions, from friendly fraud to counterfeit cards.

RiskShield helps to keep the chargebacks low and it will safeguard an organization against fraudulent and inexperienced merchants. It will allow for additional revenues to be safely and securely generated even when doing business with risky merchants such as online gambling and travel booking sites.

## Resolved Issues

We addressed the following issues in the current release to ensure your experience is top notch!

TFS ID	Description
236689	Separate DelayedCharges & Reauthorization Resubmission from the txn family
